As a first approximation, when b is small compared to v, we obtain $p = \frac{NK\theta}{v}$ (Boyle-Charles-Avogadro Law), and as a second approximation we obtain

$$p = \frac{NK\theta}{v - b}$$
 (van der Waals correction).

We also note that

$$pV = \mathcal{N}K\theta \cdot \frac{x}{1 - e^{-x}}, \text{ where } x = \frac{\beta p}{K\theta}$$
 (4)

To account for the influence of internal forces, we multiply, following the lead of Dieterici, the above expression (3) by $e^{-\frac{a}{NK\theta\nu}}$, a having the same significance as before.

From this equation of state, we can easily verify the following results for the critical point:

Critical volume,
$$V_c = \frac{2e}{e-1} b = 3.166b$$
, $K = \frac{NK\theta_c}{p_c V_c} = 3.513$,

The corresponding values of V_c from the van der Waals and the Dieterici equations are (3b, 2b) respectively, and of K are $\left(\frac{8}{3} = 2.66, \frac{e^2}{2} = 3.695\right)$ respectively.

As a matter of fact, for the simpler gases, the value of 'K' obtained in this paper agrees better with the experimental results than the Dieterici value $\frac{e^2}{2}$; we have for oxygen² K=3.346, for nitrogen³ K=3.53, for argon⁴ K=3.424, for xenon⁵ K=3.605. We need not consider the van der Waals value $\frac{8}{3}$, for it fails entirely.

The most serious drawback to Dieterici's equation is, according to Prof. Lewis (vide Lewis's Physical Chemistry, vol. ii. p. 117) that it makes b or the limiting volume $=\frac{V_c}{2}$, while the limiting volume, obtained by the extrapolation of Cailletet-Mathias mean density line to the temperature $\theta=0^\circ K$ is about $\frac{V_c}{4}$. The value of b obtained

in this paper, viz., $\frac{V_c}{3.16}$ therefore agrees better with this value.

gation will have on the speculations concerning the variabi-

It is yet premature to predict what influence this investi-

lity of the volume of molecules with temperature. A more detailed investigation dwelling upon this point, and the application of the formula (4) to Amagat's (pv, p) curves, will be communicated shortly. Meanwhile we point out that the factor $e^{-\frac{a}{NK\theta v}}$ has been introduced into the expression for 'p' only as a provisional measure, though it is considered that this step, though not quite exact, is one in the right direction. In the next paper an attempt will be made to introduce energy into probability calcula-

Sir T. N. Palit Laboratory of Science, Calcutta.

Note added in proof.—On consulting the literature on the subject, we noticed that in several papers in the Amsterdam Proceedings (vide vol. xv. p. 240 et seq.), Dr. Keesom of Leyden had also made attempts to deduce the equation of state from Boltzmann's entropy principle. But, in the expression (2) for W, he introduces, before differentiation, an approximation in which terms up to second order in b/v are retained only. In this way, he arrives at the van der Waals' form v-b for the influence of finite molecular volumes. In obtaining our present equation of states (4), no such approximation has been made.

7. ON THE MECHANICAL AND ELECTRODYNAMICAL PROPERTIES OF THE ELECTRON

tions.

(Phys. Rev., 13, 34, 1919)

The object of the present paper is to extend Minkowski's method¹ of four-dimensional analysis to the investigation of the mechanical and electrodynamical problems connected

with the electron. As is well known, Minkowski's four dimensional analysis is based on the principle of relativity, and we have thereby to abandon two time-honored concepts of physics, i.e., absolute independence of time and space, and the constancy of mass. The correctness of these two principles is no longer a matter of hypothesis, but is founded on experiments. It is therefore to be hoped

²Mathias and K. Onnes, Proc. Amst., Feb. 1911.

^{*}Berthelot, Bull. de la Soc. France de Phys., 167 (1901).

⁴Mathias, Onnes, and Crommelin, Proc. Amst., 1913, p. 960, vol. xv. ⁵Paterson, Cripps, Whytlaw-Gray, Proc. Roy. Soc. Lond. A. lxxxvi, p. 579 (1912).

¹Minkowski's method of four-dimensional analysis is expounded in two papers: (1) Raum und Zeit, published in the Phys. Zeits., and (2) Die Grundgleichungen für die Electro-magnetischen Vorgänge n bewegten Körpern-Gött. Nach, 1908. These two papers have been translated by me, and are being published by the Calcutta University.

that the results of these investigations will be helpful to us for the elucidation of the mechanical and electrical problems connected with the electron, though sometimes difficulty may be encountered in putting proper interpretation on these results.

The notation is the same as that adopted by Minkowski and for the convenience of the reader, it is explained at the very outset.

 $(x, y, z, l \pm ict)$ denotes the space and time coordinates of any point in the four-dimensional world

$$(w_1, w_2, w_3, w_4) = \sqrt{\frac{1}{1 - \frac{u^2}{c^2}}} \left[\frac{u_1}{c}, \frac{u_2}{c}, \frac{u_3}{c}, i \right]$$

denctes the velocity four-vector of the point

We put
$$ds^2 = -(dx^2 + dy^2 + dz^2 + dl^2)$$

therefore we have

$$(w_1, w_2, w_3, w_4) = \left(\frac{dx}{ds}, \frac{dy}{ds}, \frac{dz}{ds}, \frac{dl}{ds}\right),$$

and $\sqrt{-1}(w_1, w_2, w_3, w_4)$

denote the direction cosines of the four-dimensional tangent to the path of the particle. c=velocity of light in space.

We put
$$(f_{23}, f_{31}, f_{12}) = (H_x, H_y, H_z)$$
,

the components of the magnetic field, and

$$(f_{14}, f_{24}, f_{34}) = -i [E_x, E_y, E_z],$$

the components of the electric field. Minkowski has shown that f constitutes a six-vector.

$$(a_1, a_2, a_3, a_4) = [F, G, H, l \phi],$$

are the components of the potential four-vector; (F, G, H)are the vector potentials, ϕ is the scalar potential.

 ρ = electrical space-density;

$$\rho\left[\frac{u_1}{c}, \frac{u_2}{c}, \frac{u_3}{c}, i\right] = \rho_o\left(w_1, w_2, w_3, w_4\right)$$

are the components of the stream four-vectors;

$$\rho_o = \rho \sqrt{1 - \frac{u^2}{c^2}}$$

is known as the rest-density of electricity.

The vector operator

$$\Box = \left(i\frac{\partial}{\partial x} + j\frac{\partial}{\partial y} + k\frac{\partial}{\partial z} + \frac{\partial}{\partial l}\right),\,$$

is known as the lor and the scalar operator

$$\Box^2 = \left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2} + \frac{\partial^2}{\partial l^2}\right)$$

is known as the generalised D'Alembertian.

The equations of electrodynamics can be written in the forms

2. The Scalar and Vector Potentials of a Moving Electron.

Lienard,² and almost simultaneously Wiechert³ showed that the scalar and vector potentials are given by the expressions

$$\phi = -\frac{e}{r\left(1 - \frac{ur}{c}\right)}, \quad (F, G, H) = -\frac{e\left(u_1, u_2, u_3\right)}{cr\left(1 - \frac{ur}{c}\right)}, \quad (1)$$

If P be the point at which the potentials are calculated at the time t and M be the position of the electron at the time t_0 where $MP = c(t - t_0)$, the distance MP is denoted by r and [u] denotes the velocity in the position M, and (ur)its component in the direction of r.

The formulae are deduced from the theory of retarded potential and do not involve the principle of relativity.

Several investigators4 have shown that the formulae can also be deduced from the theory of relativity and can be thrown into the compact form

$$a = \frac{e[\omega]}{[R\omega]},\tag{2}$$

R being the four-vector joining the two points, $[R.\omega]$ denoting the scalar product of R and ω .

It is quite clear that the forms (1) and (2) are quite equivalent.

In a paper published elsewhere, it has been shown that from Minkowski's four-dimensional analysis we obtain

$$a = \frac{e[\omega]}{P}. (3)$$

In this formula, (x, y, z, l) denote the time-space coordinates of the electron (A), $(\omega_1, \omega_2, \omega_3, \omega_4)$ its velocity components, (x', y', z', l') denote the space-time coordinates of the point B at which the potentials are estimated.

P denotes the four-dimensional perpendicular distance of B from the axis of motion of (A); since the directioncosines of this axis are -i (ω_1 , ω_2 , ω_3 , ω_4), we have

$$\begin{array}{c} p^2 = (x-x')^2 + (y-y')^2 + (z-z')^2 + (l-l')^2 + [(x-x')\omega_1 \\ + (y-y')\omega_2 + (z-z')\omega_3 + (l-l')\omega_4]^2 \\ = R^2 + \lceil R\omega \rceil^2. \end{array}$$

Now if we make the assumption that the time coordinates are so chosen that

$$R^{2} = (x-x')^{2} + (y-y')^{2} + (z-z')^{2} + (l-l')^{2} = 0$$
i.e., $c^{2}(t-t')^{2} = r^{2}$,
i.e., $c(t-t') = r$, (4)

the formula (3) becomes the same as (2) and therefore (1). Also the assumption which we make here about the interval between the time coordinates is identical with the premises of Lienard and Wiechert.

I am not quite certain whether this assumption (4)

²Lienard, L'eclairage electrique, 16 (1898), pp. 5, 53 and 106.

Wiechert, Arch. Neérl., (2), 5 (1900).

Sommerfeld, Über die Relativitäts-theorie, Ann. d. Physik, Vols.

which is made here is at all essential. I am inclined to think that it is not essential, but necessary only for the interpretation of the result to those three-dimensional beings whose senses are not sharpened enough to enable them to grasp a result expressed in four-dimensional figures.

3. The Electric and Magnetic Fields due to a Moving Electron.

If a denote the potential four-vector, the components of the six-vector f giving the electric and magnetic fields are given by

$$f=\text{Curl } a=\left|\begin{array}{ccc} \frac{\partial}{\partial x'} & \frac{\partial}{\partial y'} & \frac{\partial}{\partial z'} & \frac{\partial}{\partial l'} \\ a_1 & a_2 & a_3 & a_4 \end{array}\right|.$$

Thus
$$f_{12} = \frac{\partial a_2}{\partial x'} - \frac{\partial a_1}{\partial y'} = \frac{e}{P^3} \left[\omega_3 \, \alpha_2 - \omega_2 \, \alpha_3 \right], \text{ etc.}$$
 (5)

where
$$\alpha_1 = P \frac{\partial P}{\partial x'}$$
, $\alpha_2 = P \frac{\partial P}{\partial y'}$...etc.

we can easily verify that if we put c(t-t')=r, we have

$$H_{x} = \frac{e\beta^{2}}{r^{3}\lambda^{3}} \left[\frac{u_{2}}{c} (z - z') - \frac{u_{3}}{c} (y - y') \right],$$

$$\lambda = \left(1 - \frac{Ur}{c} \right),$$

$$= \frac{e\beta^{2}}{r^{3}\lambda^{3}} \left[\mathbf{u} \times \mathbf{r} \right].$$
(6)

The electric forces are given by

$$f_{14} = -iE_x = \frac{\partial a_4}{\partial x'} - \frac{\partial a_1}{\partial l'},$$

$$= \frac{e}{P^3} \left[\omega_1 \left(l - l' \right) - \omega_4 \left(x - x' \right) \right],$$

$$= -i \frac{e\beta^2}{r^3 \lambda^3} \left[r \frac{u_1}{c} - \left(x - x' \right) \right], \tag{7}$$

and generally

where

$$E_x = \frac{e\beta^2}{r^3\lambda^3} \left[(x-x') - \frac{ru_1}{c} \right], \ E = \frac{e\beta^2}{r^3\lambda^3} \left[r - \frac{ru}{c} \right].$$

These values are widely different and simpler than the values obtained from the older theories, for example, compare the values given by Crehore⁵.

The discrepancy is due to the fact that in these older theories, we always assume that the equation

$$(x-x')^2+(y-y')^2+(z-z')^2+(l-l')^2=0$$

is an essential condition. But in performing differentiations with regard to (x', y', z', l') we here assume that they are quite independent of (x, y, z, l). I am not quite definite as to which of these two standpoints is correct but I am inclined to think that my standpoint is more in accordance with Minkowski's ideas of time and space. However it is preferable to keep an open mind on this point.

4. Maxwell's Stresses, Poynting-Vector, Etc.

Minkowski has shown that if we multiply f by its own matrix, we obtain a matrix

where
$$S_{11} = \frac{1}{2} [f_{23}^2 + f_{34}^2 + f_{42}^2 - f_{12}^2 - f_{13}^2 - f_{14}^2],$$

 $S_{12} = [f_{13}f_{32} + f_{14}f_{42}],$
 $L = \frac{1}{2} [f_{23}^2 + f_{32}^2 + f_{12}^2 + f_{14}^2 + f_{24}^2 + f_{34}^2],$

and the matrix

$$\frac{1}{4\pi} \begin{vmatrix} S_{11} & S_{12} & S_{13} \\ S_{21} & S_{22} & S_{23} \\ S_{31} & S_{32} & S_{33} \end{vmatrix} = \begin{vmatrix} X_x & X_y & X_s \\ Y_x & Y_y & Y_s \\ Z_x & Z_y & Z_z \end{vmatrix}$$

denote the Maxwellian stresses, i (S_{14} , S_{24} , S_{34}) denote the components of the Poynting-vector, and S_{44} is the energy function. We have generally

$$X_{x} = \frac{1}{8\pi} \left[f_{23}^{2} + f_{34}^{2} + f_{42}^{2} - f_{12}^{2} - f_{13}^{2} - f_{14}^{2} \right],$$

$$X_{y} = \frac{1}{4\pi} \left[f_{13} f_{32} + f_{14} f_{42} \right], \text{ etc.}$$
(8)

Now on the standpoint taken up by me, it is quite easy to calculate these qualities. It can be shown that

$$X_{x} = \frac{e^{2}}{8\pi P^{2}} \left[-P^{2} \left(1 + 2\omega_{1}^{2} \right) + \kappa_{1}^{2} \right], \quad X_{y} = \frac{e^{2}}{8\pi P^{6}} \left[-\omega_{1}\omega_{2}P^{2} + \kappa_{1}\kappa_{2} \right]. \quad (9)$$

The Poynting-Vector

$$(X_1, Y_1, Z_1) = \frac{e^2}{8\pi P^6} [(-w_1 w_4 P^2 + \epsilon_1 \epsilon_4), (-w_2 w_4 P^2 + \epsilon_2 \epsilon_4), (-w_3 w_4 P^2 + \epsilon_3 \epsilon_4)]$$

and the energy function

$$S_{44} = L = \frac{e^2}{8\pi P^6} \left[-P^2 \left(1 + 2w_4^2 \right) + \kappa_4^2 \right]$$

where $\mathbf{\alpha}_1 = P \frac{\partial P}{\partial x'}, \mathbf{\alpha}_2 = P \frac{\partial P}{\partial y'}, \text{ etc.}$

and $\mathbf{c}^2 = \mathbf{c_1}^2 + \mathbf{c_2}^2 + \mathbf{c_3}^2 + \mathbf{c_4}^2 = P^2$

5. The Law of Attraction between Two Moving Electrons.

We can now proceed to find out the attraction which one moving electron exerts upon another moving electron.

According to Lorentz's theorem the components of the force acting on an electron (A) moving in any electromagnetic field are

$$X=e \left[w_{2} f_{12}+w_{3} f_{13}+w_{4} f_{14}\right],$$

$$Y=e \left[w_{1} f_{21}+w_{3} f_{23}+w_{4} f_{24}\right],$$

$$Z=e \left[w_{1} f_{31}+w_{2} f_{32}+w_{3} f_{34}\right],$$
(10)

and we can also add the fourth or the time component

$$L = -\frac{ie}{c} [X u_1 + Y u_2 + Z u_3], \ \beta = \sqrt{1 - \frac{v^2}{c^2}}$$

⁵Phys. Rev., July, 1917, p. 448.

which is proportional to the rate at which work is done by the moving charge,—we have

$$L = e[w_1 f_{41} + w_2 f_{42} + w_3 f_{43}].$$

In this case, the field is due to the second electron (charge e', position x'y'z'l', velocity components $w_1' w_2' w_3' w_4'$).

According to the last section, the potential four-vector

$$a = \frac{e'[w']}{P'}$$
, where $P'^2 = R^2 + [Rw']^2$.

We have now, since f = Curl a,

$$\begin{split} X &= ee' \left[w_2 \left\{ \frac{\partial}{\partial x} \left(\frac{w_2{}'}{P'} \right) - \frac{\partial}{\partial y} \left(\frac{w_1{}'}{P} \right) \right\} + w_3 \left\{ \frac{\partial}{\partial x} \left(\frac{w_3{}'}{P'} \right) \right. \\ & \left. - \frac{\partial}{\partial z} \left(\frac{w_1{}'}{P'} \right) \right\} + w_4 \left\{ \frac{\partial}{\partial x} \left(\frac{w_4{}'}{P'} \right) \frac{\partial}{\partial l} \left(\frac{w_1{}'}{P'} \right) \right\} \right] \\ &= ee' \left[\frac{\partial}{\partial x} \left(\frac{w_1 w_1{}' + w_2 w_2{}' + w_3 w_3{}' + w_4 w_4{}'}{P'} \right) \right. \\ & \left. - \left(w_1 \frac{\partial}{\partial x} + w_2 \frac{\partial}{\partial y} + w_3 \frac{\partial}{\partial z} + w_4 \frac{\partial}{\partial l} \right) \left(\frac{w_1{}'}{P'} \right) \right], \end{split}$$

Now putting $\Phi = ee' (w_1w_1' + w_2w_2' + w_3w_3' + w_4w_4')/P'$,

we find that
$$X = \frac{\partial \phi}{\partial x} - \frac{d}{ds} \left(\frac{\partial \Phi}{ds} \right)$$
.

where $\frac{\partial}{\partial x}$ denotes differentiation in which x is explicitly involved, similarly with

$$\frac{\partial w_1}{\partial w_1} = \frac{\partial}{\partial \frac{dx}{ds}},$$

$$\frac{d}{ds} = \left(w_1 \frac{\partial}{\partial x} + w_2 \frac{\partial}{\partial y} + w_3 \frac{\partial}{\partial z} + w_4 \frac{\partial}{\partial l}\right),\,$$

as is easily seen. We have similarly

$$\Upsilon = \frac{\partial \Phi}{\partial y} - \frac{d}{ds} \left(\frac{\partial \Phi}{\partial \frac{dy}{ds}} \right), \quad \mathcal{Z} = \frac{\partial \Phi}{\partial z} - \frac{d}{ds} \left(\frac{\partial \Phi}{\partial \frac{dz}{ds}} \right),$$

$$L = \frac{\partial \Phi}{\partial l} - \frac{d}{ds} \left(\frac{\partial \Phi}{\partial \frac{dl}{ds}} \right).$$
(11)

We can say that ϕ is the kinetic-potential of the electron (A) in the field of the electron (B). Similarly if ϕ' denote the Kinetic-potential of the electron (B) in the field of (A),

$$\phi' = ee'(w_1w_1' + w_2w_2' + w_3w_3' + w_4w_4')/P,$$

$$P^2 = R^2 + (Rw)^2.$$

and we have similarly

$$X' = \frac{\partial \Phi'}{\partial x'} - \frac{d}{ds'} \left(\frac{\partial \Phi'}{\partial ds'} \right), \tag{12}$$

Let us now interpret the results in three dimensions. We have

$$X = \frac{ee'\beta'^2}{r^3\lambda^3\beta'} \left(x - x'\right) \left(1 - \frac{uv \cos\theta}{c^2}\right) - \frac{ee'\beta'^2}{r^2\lambda^3\beta^2} \left(1 - \frac{Ur}{c}\right) u'_1,$$

where
$$\beta = \sqrt{1 - \frac{v^2}{c^2}}$$
, $\beta' = \sqrt{1 - \frac{v'^2}{c^2}}$, $\lambda = \left(1 - \frac{Ur'}{c}\right)$. (13)

In three dimensions, the forces are equivalent to a force of repulsion

$$\frac{ee' \beta'^2}{r^3 \lambda^3 \beta} \left(1 - \frac{uv \cos \theta}{c^2}\right) r,$$

in the direction of the line joining the two points, and a force \mathcal{I}

$$\frac{ee'\beta'^2}{r^2\lambda^3\beta^c}\left(1-\frac{Ur}{c}\right)\mathbf{u'},\tag{14}$$

in the direction of the velocity of the second or the attracting point.

We thus perceive that the force which comes out in a very simple form in four dimensions takes a very complicated form in three dimensions.

The kinetic potential

$$\phi = \frac{ee'\left(1 - \frac{vv'\cos\theta}{c^3}\right)}{r\left(1 - \frac{U'r}{c}\right)\beta}.$$
 (15)

This kinetic potential is practically coincident with the kinetic potential assumed by Clausius in order to find out the law of attraction between two moving charges of electricity; Clausius has shown that this kinetic potential leads to the celebrated electrodynamic laws of Ampere. A short resumé of the work done in this connection is given below for the purpose of comparison. The problem was first enunciated by Gauss in the year 1835, and was called by him the fundamental keystone of electrodynamics. (1) Gauss (1835): The forces are the derivatives with regard to (x, y, z) of the potential function,

$$\phi = \frac{ee'}{r} \left(1 - \frac{3}{2c} \frac{d^2r}{dt^2} \right).$$

(2) Weber (1843) takes the potential function

$$\phi = \frac{ee'}{r} \left(1 - \frac{1}{c^2} \frac{dr^2}{dt} \right).$$

Both of these forms have been long discredited. Later writers have pointed out that the force cannot be simply the derivations with regard to (x, y, z) of some potential function, but are the Lagrangian derivatives of a certain kinetic-potential. We give the form of this kinetic-potential according to different investigators.

(1) Clausius (1881):

$$\phi = \frac{ee'}{r} \left(1 - \frac{uu' \cos \theta}{c^2} \right),$$

where u and u' are the velocities of the two electrons, and θ is the angle between their lines of motion. In two papers communicated to the Grele's journal, Clausius deduces Ampere's law of electrodynamical action between two currents from this law.

⁶For the literature on the subject, see Maxwell, Electricity and Magnetism, Vol 2, chap. XXIII, and J. J. Thomson, Application of Dynamics to Problems of Physics and Chemistry, pp. 35.

⁷Vols. 82 and 83.

(2) J. J. Thomson:

$$\phi = \frac{ee'}{r} \left(1 - \frac{\mu}{3c^2} uu' \cos \theta \right) (\mu = \text{magnetic permeability} = 1).$$

Crehore⁸ has calculated the forces components according to J. J. Thomson's theory. He finds that the forces are equivalent to

 $F_1 = \frac{ee'}{r^2}$, a repulsion along the line joining the centres.

 $F_2 = \frac{ee'}{c^2r^2}uu'\cos\theta$, an attraction along the same line.

 $F_3 = \frac{ee'}{r} u'$, a force in the direction opposite to the acceleration of the second charge.

 $F_4 = ee' u' \frac{d}{dt} \left(\frac{1}{r}\right)$, a force in a direction opposite to the velocity of the second charge.

(3) Sommerfeld¹⁰ has also calculated the ponderomotive forces, assuming that the value of the potential four-vector

$$a=\frac{e[\omega]}{(R\omega)},$$

and using the condition

$$(x-x')^2+(y-y')^2+(z-z')^2+(l-l')^2=0$$

in course of differentiation. Their forms are a bit too complicated.

6. Equations of Motion of the Electron.

Minkowski¹¹ deduces the equations of motions of ponderable particle by means of a variational process in which the function

$$\int m_0 c^2 ds$$
, where $ds^2 = -(dx^2 + dy^2 + dz^2 + dl^2) = c^2 dt^2$ $\left(1 - \frac{u^2}{c^2}\right)$

is used instead of the three-dimensional \(\textit{T} dt. \)

He obtains

$$m_o c^2 \frac{d^2 x}{ds^2} = X$$
, $m_o c^2 \frac{d^2 y}{ds^2} = Y$, $m_o c^2 \frac{d^2 z}{ds^2} = Z$, $m_o c^2 \frac{d^2 l}{ds^2} = L$. (16)

Now we have

$$X=e[w_2f_{12}+w_3f_{13}+w_4f_{14}],$$

according to Lorentz's theorem. We have also

according to Lorentz's theorem. We have also
$$\frac{d^2x}{ds^2} = \left(w_1 \frac{\partial}{\partial x} + w_2 \frac{\partial}{\partial y} + w_3 \frac{\partial}{\partial z} + w_4 \frac{\partial}{\partial l}\right) w_1$$

$$= w_1 \frac{\partial}{\partial x} \left[\frac{1}{2} \left(w_1^2 + w_2^2 + w_3^2 + w_4^2\right)\right] + w_2 \left[\left(\frac{\partial w_1}{\partial y} - \frac{\partial w_2}{\partial x}\right) + w_3 \left(\frac{\partial w_1}{\partial z} - \frac{\partial w_3}{\partial x}\right) + w_4 \left(\frac{\partial w_1}{\partial l} - \frac{\partial w_4}{\partial x}\right)\right]$$

$$= -(w_2 \Omega_{12} + w_3 \Omega_{13} + w_4 \Omega_{14}), \text{ putting } \Omega_{hk} = \frac{\partial w_k}{\partial x_h} - \frac{\partial w_h}{\partial x_k}.$$

Hence we have the four equations, putting $\mu = c^2 m_0/e$,

Of these, only three are independent; the fourth can be deduced from the first three.

We have now identically

$$\begin{vmatrix} f_{12} + \mu \Omega_{12} & f_{13} + \mu \Omega_{13} & f_{14} + \mu \Omega_{14} \\ f_{21} + \mu \Omega_{21} & f_{23} + \mu \Omega_{23} & f_{24} + \mu \Omega_{24} \\ f_{31} + \mu \Omega_{31} & f_{32} + \mu \Omega_{32} & f_{34} + \mu \Omega_{34} \\ f_{41} + \mu \Omega_{41} & f_{42} + \mu \Omega_{42} & f_{43} + \mu \Omega_{43} \end{vmatrix} = 0,$$

i.e.
$$(f_{12} + \mu\Omega_{12}) (f_{34} + \mu\Omega_{34}) + (f_{23} + \mu\Omega_{23}) (f_{14} + \mu\Omega_{14}) + (f_{31} + \mu\Omega_{31}) (f_{24} + \mu\Omega_{24}) = 0.$$
 (17)

The condition is evidently satisfied if we put

$$-\mu = \frac{f_{12}}{\Omega_{12}} = \frac{f_{23}}{\Omega_{23}} = \frac{f_{31}}{\Omega_{31}} = \frac{f_{14}}{\Omega_{14}} = \frac{f_{24}}{\Omega_{24}} = \frac{f_{34}}{\Omega_{34}}.$$
 (18)

If of these equations, any three are satisfied the remaining three come out automatically from the equations of motions. But we cannot possibly be sure of the authenticity of these relations unless it can be deduced from an independent source. For this purpose let us take the original variational equations.

Let (X, Υ, Z, L) represent the components of the force four-vector at any point, which is subjected to a virtual displacement δx , δy , δz , δl .

Then $\delta W = X \delta x + \Upsilon \delta y + Z \delta z + L \delta l$, i.e., if we call

$$W = \frac{\partial A}{\partial s}$$
, $A = \int W ds$,

$$\begin{split} \delta A &= \int \delta W ds = \int (X \delta x + Y \delta y + Z \delta z + L \delta l) \ ds \\ &= e \int [f_{12} (dy \delta x - \delta y dz) + f_{23} (dz \delta y - \delta z dy) \\ &+ f_{31} (dx \delta z - \delta x dz) + f_{14} (dl \delta x - \delta l dx) + f_{24} (dl \delta y - \delta l dy) \\ &+ f_{34} (dl \delta z - \delta l dz)]. \end{split}$$

Now the function $\int m_0 c^2 ds$ can also be subjected to a variational process. Since

$$ds = w_1 dx + w_2 dy + w_3 dz + w_4 dl,$$

we find

$$\begin{split} \delta \mathit{\int} \mathit{m}_{0}\mathit{c}^{2} \mathit{d} \mathit{s} &= -\mathit{m}_{0}\mathit{c}^{2} \mathit{\int} [\varOmega_{12} \delta S_{12} + \varOmega_{23} \delta S_{23} + \varOmega_{31} \delta S_{31} + \varOmega_{14} \delta S_{14} \\ &+ \varOmega_{24} \delta S_{24} + \varOmega_{34} \delta S_{34}], \end{split}$$

where

$$\delta S_{hk} = dx_k \, \delta x_h - \delta x_k dx_h$$

Thus from the variational equation

$$\delta \int m_0 c^2 ds + \int \delta W ds = 0;$$

i.e., from the principle of least action, keeping the initial and final points fixed, we obtain the original equation

$$\int [(f_{12} + \mu \Omega_{12}) \delta S_{12} + \dots] = 0$$

The relations (18) thus seem to be borne out by independent evidence.

⁸It will be seen that forces F_1 , F_2 , F_3 are, but for some minor details, represented in our formula. Force F_3 does not occur at all.

Difficulty is encountered here about the interpretation of the terms $(\Omega_{12}, \Omega_{23}, \ldots)$ in three dimensions Ω is evidently a six-vector being the four-dimensional curl of the velocity four-vector. The components $[\Omega_{23}, \Omega_{31}, \Omega_{12}]$ are evidently connected with rotations

$$\left[\frac{\delta u_3}{\delta y} - \frac{\delta u_2}{\delta z}, \quad \frac{\delta u_1}{\delta z} - \frac{\delta u_3}{\delta x}, \quad \frac{\delta u_2}{\delta x} - \frac{\delta u_1}{\delta y}\right]$$

and $[\Omega_{14}, \Omega_{24}, \Omega_{34}]$ are connected with the accelerations

$$\begin{bmatrix} \frac{d^2x}{dt^2}, & \frac{d^2y}{dt^2}, & \frac{d^2z}{dt^2} \end{bmatrix}$$

but the exact interpretation in three dimensions has not yet been obtained. We can style Ω as the acceleration sixvector.

On a future occasion, I hope to communicate the result of my investigations on the orbits of the electron under different conditions.

In conclusion, I wish to express my best thanks to my friend, Mr. S. N. Basu, for much help, and useful criticism.

ON THE MECHANICAL AND ELECTRODYNAMICAL PROPERTIES OF THE ELECTRON: ADDENDUM

(Phys. Rev., 13, 238, 1919.)

It appears that the relation

$$-\mu = -\frac{m_0c^2}{e} = \frac{f_{12}}{\Omega_{12}} = \frac{f_{23}}{\Omega_{23}} = \frac{f_{31}}{\Omega_{31}} = \frac{f_{14}}{\Omega_{14}} = \frac{f_{24}}{\Omega_{24}} = \frac{f_{34}}{\Omega_{34}},$$

which was given in my paper¹ "On the Mechanical and Electrodynamical Properties of the Electron" and which was obtained from the determinant

$$\begin{vmatrix} f_{12} + \mu \Omega_{12} & f_{13} + \mu \Omega_{13} & f_{14} + \mu \Omega_{14} \\ f_{21} + \mu \Omega_{21} & f_{23} + \mu \Omega_{23} & f_{24} + \mu \Omega_{24} \\ f_{31} + \mu \Omega_{31} & f_{32} + \mu \Omega_{32} & f_{34} + \mu \Omega_{34} \\ f_{41} + \mu \Omega_{41} & f_{42} + \mu \Omega_{42} & f_{43} + \mu \Omega_{43} \end{vmatrix} = 0$$

or

$$(f_{12} + \mu\Omega_{12})(f_{34} + \mu\Omega_{34}) + (f_{23} + \mu\Omega_{23})(f_{14} + \mu\Omega_{14}) + (f_{31} + \mu\Omega_{31})(f_{24} + \mu\Omega_{24}) = 0,$$

cannot hold. For, from the principle of least action written in Minkowski's form,

$$\delta \int m_o c^2 ds - \int \delta W ds = 0$$

we obtain the relation

$$\iint [(f_{12} + \mu \Omega_{12}) (dx \delta y - \delta x dy)] + 5 \text{ other similar terms} = 0.$$

But it is not possible to equate to zero the coefficients of the six-components $(dx \delta y - \delta x dy)$ of the area-six-vector $(dSx \delta s)$ as done in that paper, for though $(\delta x, \delta y, \delta z, \delta l)$ represent an arbitrary displacement (dx, dy, dz, dl), is not so, but represent the actual displacements. We have, therefore, to collect the coefficients of $(\delta x, \delta y, \delta z, \delta l)$ and put them separately equal to zero. In this way we obtain

$$\begin{split} -\frac{m_{o}c^{2}}{e} &= \frac{f_{12}w_{2} + f_{13}w_{3} + f_{14}w_{4}}{\Omega_{12}w_{2} + \Omega_{13}w_{3} + \Omega_{14}w_{4}} = \frac{f_{21}w_{1} + f_{23}w_{3} + f_{24}w_{4}}{\Omega_{21}w_{1} + \Omega_{23}w_{3} + \Omega_{24}w_{4}} \\ &= \frac{f_{31}w_{1} + f_{32}w_{2} + f_{34}w_{4}}{\Omega_{31}w_{1} + \Omega_{32}w_{2} + \Omega_{34}w_{4}} = \frac{f_{41}w_{1} + f_{42}w_{2} + f_{43}w_{3}}{\Omega_{41}w_{1} + \Omega_{42}w_{2} + \Omega_{43}w_{3}} (A) \end{split}$$

which are simply another form of the Minkowskian equations

$$m_0 c^2 \frac{d^2 x}{ds^2} = X$$
, $m_0 c^2 \frac{d^2 y}{ds^2} = Y$, $m_0 c^2 \frac{d^2 z}{ds^2} = Z$, $m_0 c^2 \frac{d^2 l}{ds^2} = L$ (A')
for $\frac{d^2 x}{ds^2} = -(w_2 \Omega_{12} + w_3 \Omega_{13} + w_4 \Omega_{14})$, etc.

The form (A) as it involves the acceleration six-vector may for certain purposes prove more convenient than the form (A').
