SELF-ORGANIZATION IN MAGNETIZED PLASMAS

by

Ramitendra Nath Bhattacharjee

Plasma Physics Division

Saha Institute of Nuclear Physics

1/AF Bidhannagar, Kolkata

INDIA

A thesis submitted to

The Jadavpur University

for the degree of

Doctor of Philosophy (Science)

2005

Contents

1 Self-organization: basis and occurrence in nature 1

1.1 Introduction 1

1.1.1 Biological Systems 3

1.1.2 Plate Tectonics 4

1.1.3 Navier-Stokes Fluids 5

1.1.4 In Astrophysics 5

1.2 Mathematical formulation 7

1.3 Summary 9

2 Self-organization in fluids: A prototype example 11

2.1 Navier-Stokes equation 11

2.2 Ideal Invariants 12

2.3 Introduction to turbulence 13

2.3.1 Kolmogorov's equilibrium theory 16

2.3.2 2-D turbulence and inverse cascade 18

2.4 Variational problem and self-organized state 19

2.5 Experimental realizations 21

2.6 Self-organization in 3-D turbulence 22

2.7 Summary 24

3 Self-Organization in magnetized plasmas: Possibilities 25

3.1 Introduction 25

3.2 Possibilities of self-organization in magnetized plasma 27

3.3 Controlled thermonuclear fusion 28
3.4 Various magnetic confinement schemes 29
3.4.1 Tokamak 30
3.4.2 Reversed-field pinch (RFP) 35
3.4.3 Spheromak 35
3.4.4 Field reversed configuration 37
3.5 Summary 38

4 Taylor's theory of plasma relaxation **39**
4.1 Introduction 39
4.2 The constraints of ideal MHD 40
4.2.1 The Woltjer constraints: Magnetic helicity 40
4.2.2 Physical significance of magnetic helicity 41
4.2.3 Variational principle and the Euler-Lagrange equation 42
4.3 The effect of finite resistivity and the Taylor state 43
4.3.1 Taylor's conjecture: Selective decay principle 44
4.3.2 Variational formulation and the Taylor state 45
4.3.3 Solution in a periodic cylinder: Bessel Function Model 46
4.3.4 Solution in spherical polar coordinates: Spheromaks 51
4.4 Drawbacks of the Taylor model 52
4.5 Summary 56

5 Post-Taylor period and further advancements **58**
5.1 Introduction 58
5.2 Principle of minimum entropy production rate 60
5.3 Principle of minimum dissipation rate 67
5.3.1 Ohmic conductors 67
5.3.2 Electrical circuits with parallel resistors 68
5.3.3 Plane Poiseuille flow 69
5.3.4 Circular Couette flow 71

5.3.5 General formulation 71
5.4 A brief review of MDR related calculations 74
5.5 Summary 77

6 Minimum dissipative relaxed states in isolated systems-I **78**
6.1 Introduction 78
6.2 Solution in cylindrical coordinate system: Reversed field pinches . . . 83
6.3 Solution in toroidal coordinate system: Tokamak, reversed- field pinch and the intermediate structures 89
6.3.1 Toroidal coordinate system 89
6.3.2 Formulation of the problem 91
6.3.3 Solution 93
6.3.4 Results and discussions 97
6.4 Solution in spherical coordinates: Spheromaks 102
6.5 Summary 109

7 Minimum dissipative relaxed states in isolated systems-II **111**
7.1 Introduction 111
7.2 Steady states in two-fluid formalism 113
7.3 Relaxed states in two-fluid formalism 116
7.3.1 MDR relaxed states in hydrogen-type plasmas 120
7.3.2 Possible MDR states in equal mass plasmas 125
7.4 Summary 131

8 Variational approach to electron-magnetohydrodynamic equilibria **133**
8.1 Introduction 133
8.2 Steady-states in EMHD formalism 134
8.3 Formulation of the problem 135
8.4 Summary 140

9 Minimum dissipative relaxed states in driven systems-I 141

9.1 Introduction 141

9.2 FRC as a minimum dissipative relaxed state 143

9.2.1 Formulation of the problem 143

9.2.2 Variational problem and the Euler-Lagrange equation 145

9.2.3 Solution 146

9.3 Flow-containing FRC as a MDR relaxed state 150

9.3.1 Formulation of the problem 151

9.3.2 Variational problem and the Euler-Lagrange equation 152

9.3.3 Solutions 153

9.4 Summary 155

10 Minimum dissipative relaxed states in driven systems-II 157

10.1 Introduction 157

10.2 Formulation of the problem 158

10.3 Minimization and Euler-Lagrange equations 163

10.4 Solutions 165

10.5 Summary 172

11 Conclusions 174

A Chandrasekhar-Kendall eigenfunctions in cylindrical coordinates 183

B Chandrasekhar-Kendall eigenfunctions in spherical polar coordinates 186
